Executive Summary

At the request of Indiana Department of Homeland Security (IDHS) Planning Division, The Polis Center performed an enhanced (Hazardus Level 2) earthquake analysis for IDHS Regions 5, 7, 8, and 10 comprising 35 counties in southern and central Indiana. For the purposes of this study, the Indiana Geological Survey (IGS) provided geological information and recommendations for modeling a 6.8 moment magnitude scenario with an epicenter at Latitude 38.41088, Longitude -87.761417, which is located in Mt. Carmel, Illinois. This scenario was chosen by the Indiana Geological Survey to simulate a Wabash Valley earthquake. The epicenter is also the location of the recent May 2010 earthquake.

Figure 1: Epicenter Location

The Hazardus-MH vsn. 2.1 (Patch 1) earthquake model was used to generate the ground motions for the modeled scenario. In order to derive the most realistic ground motions possible from Hazardus-MH, The Polis Center supplied it with maps of NEHRP (National Earthquake Hazard Reduction Program) compliant soils boundaries as well as liquefaction potential boundaries. These maps covered the entire modeled region.

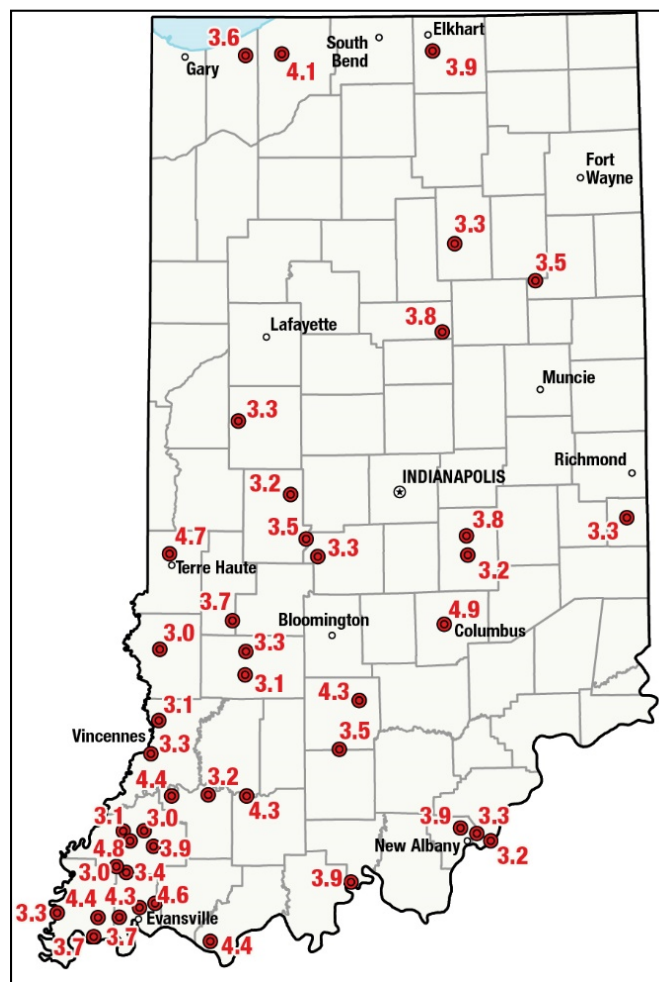

This report provides a summary of the potential impacts of the earthquake as modeled in Hazardus-MH in each of the four IDHS Regions. This includes estimates of the number of buildings damaged based on occupancies as well as potential impacts on five categories of essential facilities. Region summaries are supplemented by county level breakdowns of the same information as well as assessments of transportation impacts, displaced households, and shelter needs.

Introduction

An earthquake is a sudden, rapid shaking of the earth caused by the breaking and shifting of rock beneath the earth's surface. For hundreds of millions of years, the forces of plate tectonics have shaped Earth as the huge plates that form the Earth's crust collide, move away from, and slide past each other. This movement is extremely slow. However, when sections of the plates are locked together, stored energy is accumulated. When the accumulated energy grows strong enough, the portions of the plate break free, causing the earthquake.

At least 43 earthquakes, M3.0 or greater, have occurred in Indiana since 1817. The last such event was a M3.1 centered just north of Vincennes on May 10, 2010. A M3.8 earthquake occurred in December later that same year with approximately 10,390 individuals submitting felt-reports to the USGS.

Figure 2: Indiana Historical Earthquake Epicenters

Ninety-five percent of earthquakes occur at the plate boundaries; however, some earthquakes occur in the middle of plates, as is the case for seismic zones in the Midwestern United States. The majority of seismic activity in Indiana occurs in the southwestern region of the state. However, an even larger number of earthquakes originate just across the boundary in Illinois and can be felt in Indiana. The M5.2 Mt. Carmel event on April 19, 2008 was felt by residents in Indiana, Kentucky, and many more states across the central US.

The possibility of the occurrence of a catastrophic earthquake in the central and eastern United States is real, as evidenced by history and described throughout this section. The impacts of significant earthquakes affect large areas, terminating public services and systems needed to aid the suffering and displaced. These impaired systems are interrelated in the hardest struck zones. Power lines, water and sanitary lines, and public communication may be lost; and highways, railways, rivers, and ports may not allow transportation to the affected region. Furthermore, essential facilities, such as fire and police departments and medical care, may be disrupted if not retrofitted to resist earthquakes. Mass relocation may be necessary, but the residents who are suffering from the earthquake can neither leave the heavily impacted areas nor receive aid, or even communication, in the immediate aftermath of a significant event.

Source: Indiana Geological Survey

The Modified Mercalli (MM) Intensity Scale

The MM Intensity Scale is the commonly used scale to describe the intensity of the earthquake. It is composed of 12 increasing levels of intensity which range from ground shaking to catastrophic destruction. The lower levels of the intensity scale indicate the effect of earthquake felt by people, and the higher levels indicate the observed structural damage.

Table 1 describes the 12 levels of Modified Mercalli Intensity Scale. Table 2 describes the earthquake magnitude corresponding to the intensity levels.

Table 1: Abbreviated Modified Mercalli Intensity Scale

Modified Mercalli Intensity	Description
I	Not felt except by a very few under especially favorable conditions.
II	Felt only by a few persons at rest, especially on upper floors of buildings.
III	Felt quite noticeably by persons indoors, especially on upper floors of buildings. Many people do not recognize it as an earthquake. Standing motor cars may rock slightly. Vibrations similar to the passing of a truck. Duration estimated.
IV	Felt indoors by many, outdoors by few during the day. At night, some awakened. Dishes, windows, doors disturbed; walls make cracking sound. Sensation like heavy truck striking

Modified Mercalli Intensity	Description
	building. Standing motor cars rocked noticeably.
V	Felt by nearly everyone; many awakened. Some dishes, windows broken. Unstable objects overturned. Pendulum clocks may stop.
VI	Felt by all, many frightened. Some heavy furniture moved; a few instances of fallen plaster. Damage slight.
VII	Damage negligible in buildings of good design and construction; slight to moderate in well-built ordinary structures; considerable damage in poorly built or badly designed structures; some chimneys broken.
VIII	Damage slight in specially designed structures; considerable damage in ordinary substantial buildings with partial collapse. Damage great in poorly built structures. Fall of chimneys, factory stacks, columns, monuments, walls. Heavy furniture overturned.
IX	Damage considerable in specially designed structures; well-designed frame structures thrown out of plumb. Damage great in substantial buildings, with partial collapse. Buildings shifted off foundations.
X	Some well-built wooden structures destroyed; most masonry and frame structures destroyed with foundations. Rails bent.
XI	Few, if any (masonry) structures remain standing. Bridges destroyed. Rails bent greatly.
XII	Damage total. Lines of sight and level are distorted. Objects thrown into the air.

Table 2: Earthquake Magnitude vs. Modified Mercalli Intensity Scale

Earthquake Magnitude	Typical Maximum Modified Mercalli Intensity
1.0-3.0	I
3.0-3.9	II-III
4.0-4.9	IV-V
5.0-5.9	VI-VII
6.0-6.9	VII-IX
7.0 and higher	VIII or higher

Inventory

The Hazus-MH compliant building inventory for this study was created using GIS land parcels obtained from IndianaMAP. The detailed building characteristics were obtained from the Indiana Department of Local Government and Finance (IDLGF) for 2013. Indiana counties annually submit an extract of property appraisal data to the IDLGF. This extract contains detailed building information to include square footage, construction type, year built, foundation type, and building replacement cost.

For the purpose of this study, essential facilities are defined as those that are vital to the state in the event of a hazard. These include emergency operations centers, police departments, fire stations, schools, and care facilities. The essential facility updates have been applied to the Hazus-MH model data using data from the local multi hazard mitigation plans and the 2013 Indiana Department of Education, Indiana Department of Health, and Indiana Department of Homeland Security.

Region 5 Assessment

Overview

Region 5 has a total area of 3084.79 square miles. The 2010 census reports the counties that make up the region have a population of 1,474,128. There are an estimated 600,000 buildings in Region 5 with a total building replacement value (excluding contents) of \$ 141.4 billion.

Building Damage

Hazus estimates that about 24,862 buildings in the Region will be at least moderately damaged. There are an estimated 479 buildings that will be damaged beyond repair.

Table 3: Region 5 Building Damaged by Occupancy

Essential Facility Damage

Before the earthquake, the Region would have an estimated 36,518 medical care beds available for use. On the day of the earthquake, the model estimates that only 28,358 beds (77%) of these beds would be available for use by patients already in the medical care facilities along with those injured by the earthquake.

Overview

Boone County, Indiana is located in the northwest corner of Region 5. It has a total area of 423.25 square miles, of which 422.91 square miles is land and .34 square miles is water. The 2010 Census reports the Boone County population at 56,640, with a reported population density of 134 inhabitants per square mile.

There are an estimated 22 thousand buildings in Boone County with a total building replacement value (excluding contents) of \$5.8 billion. Approximately 88 % of the buildings (and 74% of the building value) are associated with residential housing.

In terms of building construction types found in the county, wood frame construction makes up 59% of the building inventory. The remaining percentage is distributed between the other general building types (concrete, steel, masonry, manufactured housing).

For essential facilities, there are 23 medical care facilities in the county with a total bed capacity of 1,500 beds. The county also has 29 schools, 12 fire stations, 7 police stations, and 1 emergency operation facility. With respect to high potential loss facilities (HPL), there are 7 dams identified within the county. Of these, 1 of the dams is classified as 'high hazard'. The inventory also includes 8 hazardous material sites.

Damages

The extent of the damages from a 6.8 Magnitude at Mt. Carmel, Illinois epicenter would encompass all areas of Boone County.

Building Damages

Hazus estimates that about 767 buildings in Boone County would be at least moderately damaged. This is over 3 % of the buildings in the county. An estimated 13 buildings would be damaged beyond repair.

Essential Facility Damage

Before the earthquake, the county would have an estimated 1,500 medical care facility beds available for use. On the day of the earthquake, the model estimates that only 1,174 (78%) would be available for use by patients already in these facilities along with those injured by the earthquake. After one week, 91% of the beds would likely be back in service. By 30 days, 98% would be operational.

Police Stations	7	0	0	7
Fire Stations	12	0	0	12

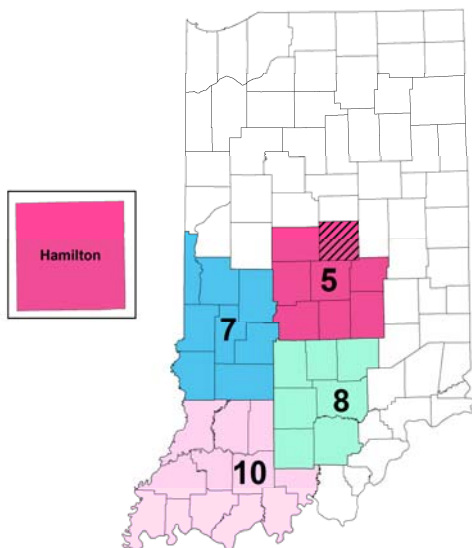

Bridge Functionality

All bridges are estimated to be functional following the earthquake. There are 262 bridges in the highway system.

Shelter Requirement

Hazus estimates the number of households that might be displaced from their homes due to the earthquake along with the number of displaced people that might require accommodations in temporary public shelters. The model estimates 21 households would be displaced due to the earthquake. Of these, 13 people (out of a total population of 46,107) would likely seek temporary lodging in public shelters.

Overview

Hamilton County, Indiana is located in the northeast corner of Region 5. It has a total area of 402.44 square miles, of which 394.27 square miles is land and 8.17 square miles is water. The 2010 Census reports the Hamilton County population at 274,569, is one of the fastest-growing counties in the United States.

There are an estimated 97,000 buildings in Hamilton County with a total building replacement value (excluding contents) of \$28.8 billion. Approximately 94 % of the buildings (and 77% of the building value) are associated with residential housing.

In terms of building construction types found in the county, wood frame construction makes up 67% of the building inventory. The remaining percentage is distributed between the other general building types (concrete, steel, masonry, manufactured housing).

For essential facilities, there are 115 medical care in the county with a total bed capacity of 5,650 beds. The county also has 61 schools, 29 fire stations, 9 police stations, and 1 emergency operation facility. With respect to high potential loss facilities (HPL), there are 8 dams identified within the county. Of these, 2 of the dams are classified as 'high hazard'. The inventory also includes 28 hazardous material sites.

Within Hazus, the lifeline inventory is divided between transportation and utility lifeline systems. There are seven (7) transportation systems that include highways, railways, light rail, bus, ports, ferry and airports. There are six (6) utility systems that include potable water, wastewater, natural gas, crude & refined oil, electric power and communications. The total value of the lifeline inventory is over 2.1 billion dollars. This inventory includes over 167 kilometers of highways, 268 bridges, and 6,197 kilometers of pipes.

Damages

The extent of the damages from a 6.8 Magnitude at Mt. Carmel, Illinois epicenter would encompass all areas of Hamilton County.

Building Damages

Hazus estimates that about 2,309 buildings in Hamilton County would be at least moderately damaged. This is over 2 % of the buildings in the county. An estimated 34 buildings would be damaged beyond repair.

Overview

Hancock County, Indiana is located on the east side of Region 5. It has a total area of 307.02 square miles, of which 306.01 square miles is land and 1.01 square miles is water. The 2010 Census reports the Hancock County population at 70,002 with a population density of 229 inhabitants per square mile.

There are an estimated 26,000 buildings in Hancock County with a total building replacement value (excluding contents) of \$5.1 billion. Approximately 89 % of the buildings (and 75% of the building value) are associated with residential housing. In terms of building construction types found in the county, wood frame construction makes up 41% of the building inventory. The remaining percentage is distributed between the other general building types (concrete, steel, masonry, manufactured housing).

For essential facilities, there are 30 medical care facilities in the county with a total bed capacity of 1550 beds. The county also has 22 schools, 11 fire stations, 5 police stations, and 1 emergency operation center. With respect to high potential loss facilities (HPL), there are 2 dams identified within the county. Of these, 1 of the dams is classified as 'high hazard'. The inventory also includes 18 hazardous material sites.

Within Hazus, the lifeline inventory is divided between transportation and utility lifeline systems. There are seven (7) transportation systems that include highways, railways, light rail, bus, ports, ferry and airports. There are six (6) utility systems that include potable water, wastewater, natural gas, crude & refined oil, electric power and communications. The total value of the lifeline inventory is over 1.2 billion dollars. This inventory includes over 123 kilometers of highways, 176 bridges, and 3,105 kilometers of pipes.

Damages

The extent of the damages from a 6.8 Magnitude at Mt. Carmel, Illinois epicenter would encompass all areas of Hancock County.

Building Damages

Hazus estimates that about 968 buildings in Hancock County would be at least moderately damaged. This is over 4 % of the buildings in the county. An estimated 17 buildings would be damaged beyond repair.

Overview

Johnson County, Indiana is located on the south side of Region 5. It has a total area of 321.79 square miles, of which 320.43 square miles is land and 1.36 square miles is water. The 2010 Census reports the Johnson County population at 139,654 with a population density of 436 inhabitants per square mile.

There are an estimated 49,000 buildings in Hendricks County with a total building replacement value (excluding contents) of \$10.4 billion. Approximately 91 % of the buildings (and 78% of the building value) are associated with residential housing.

In terms of building construction types found in the county, wood frame construction makes up 70% of the building inventory. The remaining percentage is distributed between the other general building types (concrete, steel, masonry, manufactured housing).

For essential facilities, there are 63 medical care facilities in the county with a total bed capacity of 3,500 beds. The county also has 45 schools, 23 fire stations, 9 police stations, and 1 emergency operation center. With respect to high potential loss facilities (HPL), there are 30 dams identified within the county. Of these, 9 of the dams are classified as 'high hazard'. The inventory also includes 15 hazardous material sites.

Within Hazus, the lifeline inventory is divided between transportation and utility lifeline systems. There are seven (7) transportation systems that include highways, railways, light rail, bus, ports, ferry and airports. There are six (6) utility systems that include potable water, wastewater, natural gas, crude & refined oil, electric power and communications. The total value of the lifeline inventory is over 1.8 billion dollars. This inventory includes over 174 kilometers of highways, 174 bridges, and 4,075 kilometers of pipes.

Damages

The extent of the damages from a 6.8 Magnitude at Mt. Carmel, Illinois epicenter would encompass all areas of Johnson County.

Building Damages

Hazus estimates that about 1,858 buildings in Johnson County would be at least moderately damaged. This is over 4 % of the buildings in the county. An estimated 34 buildings would be damaged beyond repair.

Overview

Marion County, Indiana is located in the center of Region 5. The county is consolidates with Indianapolis through a geo-political arrangement known as Unigov. It has a total area of 321.79 square miles, of which 320.43 square miles is land and 1.36 square miles is water. The 2010 Census reports the Marion County population at 903,393 making it the largest county in Indiana. The reported population density was 2,172 people per square mile.

There are an estimated 290,000 buildings in Marion County with a total building replacement value (excluding contents) of \$68.4 billion. Approximately 95 % of the buildings (and 67% of the building value) are associated with residential housing.

In terms of building construction types found in the region, wood frame construction makes up 52% of the building inventory. The remaining percentage is distributed between the other general building types (concrete, steel, masonry, manufactured housing).

For essential facilities, there are 515 medical care facilities in the county with a total bed capacity of 18,768 beds. The county also has 304 schools, 80 fire stations, 9 police stations, and 2 emergency operation centers. With respect to high potential loss facilities (HPL), there are 10 dams identified within the county. Of these, 4 of the dams are classified as 'high hazard'. The inventory also includes 425 hazardous material sites.

Within Hazus, the lifeline inventory is divided between transportation and utility lifeline systems. There are seven (7) transportation systems that include highways, railways, light rail, bus, ports, ferry and airports. There are six (6) utility systems that include potable water, wastewater, natural gas, crude & refined oil, electric power and communications. The total value of the lifeline inventory is over 7.8 billion dollars. This inventory includes over 645 kilometers of highways, 768 bridges, and 13,973 kilometers of pipes.

Damages

The extent of the damages from a 6.8 Magnitude at Mt. Carmel, Illinois epicenter would encompass all areas of Marion County.

Building Damages

Hazus estimates that about 12,231 buildings in Marion County would be at least moderately damaged. This is over 4 % of the buildings in the county. An estimated 233 buildings would be damaged beyond repair.

Overview

Owen County, Indiana is located on the east side of Region 7. It has a total area of 387.82 square miles, of which 385.29 square miles is land and 2.54 square miles is water. The 2010 Census reports the Owen County population at 21,575 with a population density of 56 inhabitants per square mile.

There are an estimated 10,000 buildings in Owen County with a total building replacement value (excluding contents) of \$1.4 billion. Approximately 66 % of the buildings (and 54% of the building value) are associated with residential housing.

In terms of building construction types found in the county, wood frame construction makes up 92% of the building inventory. The remaining percentage is distributed between the other general building types (concrete, steel, masonry, manufactured housing).

For essential facilities, there are 8 medical care facilities in the county with a total bed capacity of 534 beds. The county also has 8 schools, 8 fire stations, 3 police stations, and 1 emergency operation center. With respect to high potential loss facilities (HPL), there are 20 dams identified within the county. Of these, 3 of the dams are classified as ‘high hazard’.

Within Hazus, the lifeline inventory is divided between transportation and utility lifeline systems. There are seven (7) transportation systems that include highways, railways, light rail,

bus, ports, ferry and airports. There are six (6) utility systems that include potable water, wastewater, natural gas, crude & refined oil, electric power and communications. The total value of the lifeline inventory is over 497 million dollars. This inventory includes over 79 kilometers of highways, 133 bridges, and 3,509 kilometers of pipes.

Damages

The extent of the damages from a 6.8 Magnitude at Mt. Carmel, Illinois epicenter would encompass all areas of Owen County.

Building Damages

Hazus estimates that about 330 buildings in Owen County would be at least moderately damaged. This is over 3 % of the buildings in the county. An estimated 3 buildings would be damaged beyond repair.

Essential Facility Damage

Before the earthquake, the county would have an estimated 534 medical care facility beds available for use. On the day of the earthquake, the model estimates that only 399 beds (75%) would be available for use by patients already in these facilities along with those injured by the earthquake. After one week, 89% of the beds would likely be back in service. By 30 days, 98% would likely be operational.

Bridge Functionality

All bridges are estimated to be functional following the earthquake. There are 133 bridges in the highway system.

Shelter Requirement

Hazus estimates the number of households that might be displaced from their homes due to the earthquake along with the number of displaced people that might require accommodations in temporary public shelters. The model estimates 3 households would be displaced due to the earthquake. Of these, 1 person (out of a total population of 21,786) would likely seek temporary lodging in public shelters.

Overview

Vermillion County, Indiana is located in the northwest corner of Region 7. The Wabash River forms the western border of Vermillion County. Vermillion County is less than 10 miles from east to west at its widest point, while from north to south the county extends 37 miles. The county has a total area of 259.93 square miles, of which 256.88 square miles is land and 3.05 square miles is water. The 2010 Census reports the Vermillion County population at 16,212 with a population density of 65 inhabitants per square mile.

There are an estimated 7,000 buildings in Vermillion County with a total building replacement value (excluding contents) of \$1.1 billion. Approximately 86 % of the buildings (and 68% of the building value) are associated with residential housing.

In terms of building construction types found in the county, wood frame construction makes up 93% of the building inventory. The remaining percentage is distributed between the other general building types (concrete, steel, masonry, manufactured housing).

For essential facilities, there are 4 medical care in the county with a total bed capacity of 407 beds. The county also has 7 schools, 7 fire stations, 7 police stations, and 1 emergency operation center. With respect to high potential loss facilities (HPL), there are 6 dams identified within the county. Of these, none of the dams are classified as ‘high hazard’. The inventory also includes 48 hazardous material sites.

Within Hazus, the lifeline inventory is divided between transportation and utility lifeline systems. There are seven (7) transportation systems that include highways, railways, light rail, bus, ports, ferry and airports. There are six (6) utility systems that include potable water, wastewater, natural gas, crude & refined oil, electric power and communications. The total value of the lifeline inventory is over 1 billion dollars. This inventory includes over 92 kilometers of highways, 119 bridges, and 2,284 kilometers of pipes.

Damages

The extent of the damages from a 6.8 Magnitude at Mt. Carmel, Illinois epicenter would encompass all areas of Vermillion County.

Building Damages

Hazus estimates that about 262 buildings in Vermillion County would be at least moderately damaged. This is over 4 % of the buildings in the county. An estimated 3 buildings would be damaged beyond repair.

The 2010 Census reports the Bartholomew County population at 76,794 with a population density of 189 inhabitants per square mile.

There are an estimated 27,000 buildings in Bartholomew County with a total building replacement value (excluding contents) of \$6.1 billion. Approximately 85 % of the buildings (and 61% of the building value) are associated with residential housing.

In terms of building construction types found in the county, wood frame construction makes up 40% of the building inventory. The remaining percentage is distributed between the other general building types (concrete, steel, masonry, manufactured housing).

For essential facilities, there are 35 medical care facilities in the county with a total bed capacity of 1,600 beds. The county also has 23 schools, 19 fire stations, 4 police stations, and 1 emergency operation center. With respect to high potential loss facilities (HPL), there are 40 dams identified within the county. Of these, 9 of the dams are classified as 'high hazard'. The inventory also includes 68 hazardous material sites.

Within Hazus, the lifeline inventory is divided between transportation and utility lifeline systems. There are seven (7) transportation systems that include highways, railways, light rail,

bus, ports, ferry and airports. There are six (6) utility systems that include potable water, wastewater, natural gas, crude & refined oil, electric power and communications. The total value of the lifeline inventory is over 1.6 billion dollars. This inventory includes over 175 kilometers of highways, 244 bridges, and 4,304 kilometers of pipes.

Damages

The extent of the damages from a 6.8 Magnitude at Mt. Carmel, Illinois epicenter would encompass all areas of Bartholomew County.

Building Damages

Hazus estimates that about 1,706 buildings in Bartholomew County would be at least moderately damaged. This is over 6% of the buildings in the county. An estimated 37 buildings would be damaged beyond repair.

Essential Facility Damage

Before the earthquake, the county would have an estimated 1,600 medical care beds available for use. On the day of the earthquake, the model estimates that only 1,170 beds (73%) would be available for use by patients already in these facilities along with those injured by the earthquake. After one week, 88% of the beds would likely back in service. By 30 days, 97% would likely be operational.

Bridge Functionality

All bridges are estimated to be functional following the earthquake. There are 244 bridges in the highway system.

Shelter Requirement

Hazus estimates the number of households that might be displaced from their homes due to the earthquake along with the number of displaced people that might require accommodations in temporary public shelters. The model estimates 62 households would be displaced due to the earthquake. Of these, 37 people (out of a total population of 71,435) would likely seek temporary lodging in public shelters.

Brown County

INCORPORATED COMMUNITIES

NASHVILLE

Overview

Brown County, Indiana is located on the north side of Region 8. Nashville is the county seat and the only incorporated community in Brown County. It has a total area of 316.63 square miles, of which 311.98 square miles is land and 4.65 square miles is water. The 2010 Census reports the Brown County population at 15,242 with a population density of 49 inhabitants per square mile.

There are an estimated 7,000 buildings in Brown County with a total building replacement value (excluding contents) of \$1 billion. Approximately 86 % of the buildings (and 80% of the building value) are associated with residential housing.

In terms of building construction types found in the county, wood frame construction makes up 97% of the building inventory. The remaining percentage is distributed between the other general building types (concrete, steel, masonry, manufactured housing).

For essential facilities, there are 14 medical care facilities in the county with a total bed capacity of 200 beds. The county also has 8 schools, 8 fire stations, 4 police stations, and 1 emergency operation center. With respect to high potential loss facilities (HPL), there are 99 dams identified within the county. Of these, 36 of the dams are classified as 'high hazard'. The inventory also includes 1 hazardous material site.

Within Hazus, the lifeline inventory is divided between transportation and utility lifeline systems. There are seven (7) transportation systems that include highways, railways, light rail, bus, ports, ferry and airports. There are six (6) utility systems that include potable water, wastewater, natural gas, crude & refined oil, electric power and communications. The total value of the lifeline inventory is over 491 million dollars. This inventory includes over 71 kilometers of highways, 107 bridges, and 2,291 kilometers of pipes.

Damages

The extent of the damages from a 6.8 Magnitude at Mt. Carmel, Illinois epicenter would encompass all areas of Brown County.

Building Damages

Hazus estimates that about 65 buildings in Brown County would be at least moderately damaged. This is over 1% of the buildings in the county. The model estimates that no buildings would be damaged beyond repair.

Essential Facility Damage

Before the earthquake, the county would have an estimated 650 medical care facility beds available for use. On the day of the earthquake, the model estimates that only 521 beds (80%) would be available for use by patients already in these facilities along with those injured by the earthquake. After one week, 92% of the beds would likely be back in service. By 30 days, 98% would likely be operational.

Bridge Functionality

All bridges are estimated to be functional following the earthquake. There are 162 bridges in the highway system.

Shelter Requirement

Hazus estimates the number of households that might be displaced from their homes due to the earthquake along with the number of displaced people that might require accommodations in temporary public shelters. The model estimates 2 households would likely be displaced due to the earthquake. Of these, 2 people (out of a total population of 27,223) would likely seek temporary lodging in public shelters.

Region 10 Assessment

Overview

Region 10 has a total area of 4,714.82 square miles. The 2010 census reports the counties that make up the Region have a population of 465,855. There are an estimated 188,000 buildings in Region 10 with a total building replacement value (excluding contents) of \$ 35.5 billion.

Building Damage

Hazus estimates that about 33,253 buildings in the Region would be at least moderately damaged. An estimated 3,654 buildings would be damaged beyond repair.

MILLTOWN

TASWELL

Overview

Crawford County, Indiana is located in the southeast corner of Region 10. It has a total area of 308.72 square miles, of which 305.64 square miles is land and 3.08 square miles is water. The 2010 Census reports the Crawford County population at 10,713 with a population density of 35 inhabitants per square mile.

There are an estimated 6,000 buildings in Crawford County with a total building replacement value (excluding contents) of \$613 million. Approximately 95 % of the buildings (and 82% of the building value) are associated with residential housing.

In terms of building construction types found in the county, wood frame construction makes up 58% of the building inventory. The remaining percentage is distributed between the other general building types (concrete, steel, masonry, manufactured housing).

For essential facilities, there are 5 medical care facilities in the county with an unknown bed capacity. The county also has 6 schools, 7 fire stations, and 2 police stations. With respect to high potential loss facilities (HPL), there are 2 dams identified within the county. Of these, 1 of the dams are classified as 'high hazard'. The inventory also includes 2 hazardous material sites.

Within Hazus, the lifeline inventory is divided between transportation and utility lifeline systems. There are seven (7) transportation systems that include highways, railways, light rail,

bus, ports, ferry and airports. There are six (6) utility systems that include potable water, wastewater, natural gas, crude & refined oil, electric power and communications. The total value of the lifeline inventory is over 952 million dollars. This inventory includes over 104 kilometers of highways, 108 bridges, and 2,459 kilometers of pipes.

Damages

The extent of the damages from a 6.8 Magnitude at Mt. Carmel, Illinois epicenter would encompass all areas of Crawford County.

Building Damages

Hazus estimates that about 254 buildings in Crawford County would be at least moderately damaged. This is over 4% of the buildings in the county. The model estimates that 2 buildings would be damaged beyond repair.

Overview

Daviess County, Indiana is located on the north side of Region 10. It has a total area of 436.87 square miles, of which 429.49 square miles is land and 7.39 square miles is water. The 2010 Census reports the Daviess County population at 31,648 with a population density of 73 inhabitants per square mile.

Inventory

There are an estimated 12,000 buildings in Daviess County with a total building replacement value (excluding contents) of \$1.6 billion. Approximately 71 % of the buildings (and 56% of the building value) are associated with residential housing.

In terms of building construction types found in the county, wood frame construction makes up 73% of the building inventory. The remaining percentage is distributed between the other general building types (concrete, steel, masonry, manufactured housing).

For essential facilities, there are 20 medical care facilities in the county with a total bed capacity of 2,034 beds. The county also has 31 schools, 11 fire stations, 4 police stations, and 1 emergency operation center. With respect to high potential loss facilities (HPL), there are 14 dams identified within the county. Of these, 1 of the dams is classified as 'high hazard'. The inventory also includes 30 hazardous material sites.

Within Hazus, the lifeline inventory is divided between transportation and utility lifeline systems. There are seven (7) transportation systems that include highways, railways, light rail, bus, ports, ferry and airports. There are six (6) utility systems that include potable water, wastewater, natural gas, crude & refined oil, electric power and communications. The total value of the lifeline inventory is over 1.1 billion dollars. This inventory includes over 88 kilometers of highways, 136 bridges, and 3,793 kilometers of pipes.

Damages

The extent of the damages from a 6.8 Magnitude at Mt. Carmel, Illinois epicenter would encompass all areas of Daviess County.

Building Damages

Hazus estimates that about 1,593 buildings in Daviess County will be at least moderately damaged. This is over 13% of the buildings in the county. An estimated 55 buildings would be damaged beyond repair.

Overview

Martin County, Indiana is located on the west side of Region 10. It has a total area of 340.41 square miles, of which 335.74 square miles is land and 4.67 square miles is water. The 2010 Census reports the Martin County population at 10,334 with a population density of 31 inhabitants per square mile.

There are an estimated 4,000 buildings in Martin County with a total building replacement value (excluding contents) of \$616 million. Approximately 71 % of the buildings (and 58% of the building value) are associated with residential housing.

In terms of building construction types found in the county, wood frame construction makes up 87% of the building inventory. The remaining percentage is distributed between the other general building types (concrete, steel, masonry, manufactured housing).

For essential facilities, there are 4 medical care in the county with a total bed capacity of 69 beds. The county also has 6 schools, 6 fire stations, 3 police stations, and 1 emergency operation center. With respect to high potential loss facilities (HPL), there are 7 dams identified within the county. Of these, 2 of the dams are classified as 'high hazard'. The inventory has no hazardous material sites.

Within Hazus, the lifeline inventory is divided between transportation and utility lifeline systems. There are seven (7) transportation systems that include highways, railways, light rail, bus, ports, ferry and airports. There are six (6) utility systems that include potable water, wastewater, natural gas, crude & refined oil, electric power and communications. The total value of the lifeline inventory is over 690 million dollars. This inventory includes over 77 kilometers of highways, 61 bridges, and 2,966 kilometers of pipes.

Damages

The extent of the damages from a 6.8 Magnitude at Mt. Carmel, Illinois epicenter would encompass all areas of Martin County.

Building Damages

Hazus estimates that about 207 buildings in Martin County would be at least moderately damaged. This is over 4% of the buildings in the county. An estimated 4 buildings would be damaged beyond repair.

TROY

Overview

Perry County, Indiana is located on the west side of Region 10. It has a total area of 386.29 square miles, of which 381.73 square miles is land and 4.56 square miles is water. The 2010 Census reports the Perry County population at 19,338 with a population density of 51 inhabitants per square mile.

There are an estimated 8,000 buildings in Perry County with a total building replacement value (excluding contents) of \$1.1 billion. Approximately 72 % of the buildings (and 60% of the building value) are associated with residential housing.

In terms of building construction types found in the county, wood frame construction makes up 82% of the building inventory. The remaining percentage is distributed between the other general building types (concrete, steel, masonry, manufactured housing).

For essential facilities, there are 11 medical care in the county with a total bed capacity of 992 beds. There are 12 schools, 11 fire stations, 3 police stations, and 1 emergency operation facilities. With respect to high potential loss facilities (HPL), there are 15 dams identified within the county. Of these, 6 of the dams are classified as 'high hazard'. The inventory also includes 16 hazardous material sites.

Within Hazus, the lifeline inventory is divided between transportation and utility lifeline systems. There are seven (7) transportation systems that include highways, railways, light rail, bus, ports, ferry and airports. There are six (6) utility systems that include potable water, wastewater, natural gas, crude & refined oil, electric power and communications. The total value of the lifeline inventory is over 753 million dollars. This inventory includes over 109 kilometers of highways, 140 bridges, and 2,968 kilometers of pipes.

Damages

The extent of the damages from a 6.8 Magnitude at Mt. Carmel, Illinois epicenter would encompass all areas of Perry County.

Building Damages

Hazus estimates that about 270 buildings in Perry County would be at least moderately damaged. This is over 3% of the buildings in the county. An estimated 4 buildings would be damaged beyond repair.

Overview

Warrick County, Indiana is located on the south side of Region 10. The Ohio River forms the southern border of Warrick County. The county has a total area of 391.05 square miles, of which 384.82 square miles is land and 6.24 square miles is water. The 2010 Census reports the Warrick County population at 59,689 with a population density of 136 inhabitants per square mile.

There are an estimated 21,000 buildings in Warrick County with a total building replacement value (excluding contents) of \$4.1 billion. Approximately 91 % of the buildings (and 83% of the building value) are associated with residential housing.

In terms of building construction types found in the county, wood frame construction makes up 56% of the building inventory. The remaining percentage is distributed between the other general building types (concrete, steel, masonry, manufactured housing).

For essential facilities, there are 32 medical care facilities in the county with a total bed capacity of 1,342 beds. The county also has 20 schools, 12 fire stations, 6 police stations, and 1 emergency operation center. With respect to high potential loss facilities (HPL), there are 14 dams identified within the county. Of these, 1 of the dams is classified as 'high hazard'. The inventory also includes 56 hazardous material sites.

Within Hazus, the lifeline inventory is divided between transportation and utility lifeline systems. There are seven (7) transportation systems that include highways, railways, light rail, bus, ports, ferry and airports. There are six (6) utility systems that include potable water, wastewater, natural gas, crude & refined oil, electric power and communications. The total value of the lifeline inventory is over 1.5 billion dollars. This inventory includes over 134 kilometers of highways, 173 bridges, and 3,899 kilometers of pipes.

Damages

The extent of the damages from a 6.8 Magnitude at Mt. Carmel, Illinois epicenter would encompass all areas of Warrick County.

Building Damages

Hazus estimates that about 2,471 buildings in Warrick County would be at least moderately damaged. This is over 12% of the buildings in the county. An estimated 88 buildings would be damaged beyond repair.

Table 119: Warrick County Building Damage by Occupancy

	NONE	SLIGHT	MODERATE	EXTENSIVE	COMPLETE

Essential Facility Damage

Before the earthquake, the county would have an estimated 1,342 medical care facility beds available for use. On the day of the earthquake, the model estimates that only 212 beds (16%) would be available for use by patients already in these facilities as well as those injured by the earthquake. After one week, 26% of the beds would likely be back in service. By 30 days, 57% would likely be operational.

Table 121: Warrick County Essential Facility Damage

	TOTAL	Moderate Damage > 50%	Complete Damage > 50%	With Functionality > 50% on day 1
Medical Care	32	32	0	0
Schools	20	1	0	2
EOC's	1	1	0	0
Police Stations	6	6	0	0
Fire Stations	12	9	0	0

Bridge Functionality

There are 173 bridges in the highway system. Hazus estimates that at least 3 would be moderately damaged due to earthquake. After day 1 of the earthquake 171 bridges would likely be functional. After 7 days of the earthquake, 173 bridges would likely be functional.

Table 122: Warrick County Highway Bridge Damage and Functionality

System	Locations/Segments	At Least Mod. Damage	With Complete Damage	With >50% Functionality After Day 1	With >50% Functionality After Day 7
Highway	173	3	0	171	173

Shelter Requirement

Hazus estimates the number of households that might be displaced from their homes due to the earthquake along with the number of displaced people that might require accommodations in temporary public shelters. The model estimates 94 households would be displaced due to the earthquake. Of these, 55 people (out of a total population of 52,383) would likely seek temporary lodging in public shelters.
